- 1995 Member, Deutsche Gesellschaft für Zahnärztliche Implantologie
- 1996 President of ICOI/MCOI Winter Congress in Mexico

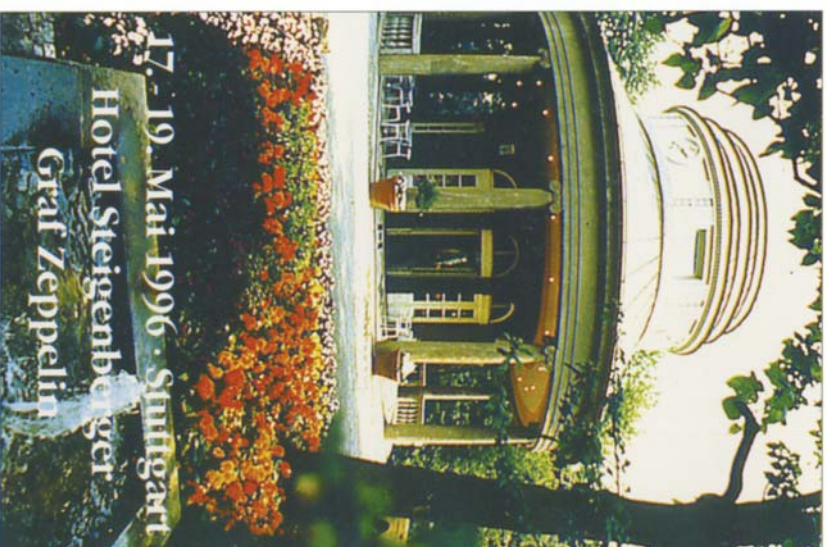

Substitution Of Natural Roots For Individual Implants

Since memorable times man has tried to replace his missing dental pieces with different types of implants. In the past, positioning individual crowns over implants was spoken about only when dealing with one single missing tooth and generally for reconstruction on only upper maxilla and its anterior portion. Nowadays the possibility exists for total reconstruction of the mandible and the maxilla with individual crowns over implants, and where it is possible, and if the bone permits (speaking of the ideal bone), make equal the number of roots that were lost and replace them with the same number of implants.
